

Wrapper Functions - Java

Below is a list of all the functions currently available in the latest version of the JAVA wrapper library.

Name	Meaning
addGroup	Create a new 'send' group
addNumbersToGroup	Add new numbers to a 'send' group
createSubAccount	Create a new account that is a sub-account of your main account
getCredits	Get the number of credits available in your account
getDeliveryReport	Get the contents of one/several delivery report(s)
getDeliveryReports	Get a list of the available delivery reports
getGroup	Get the numbers present in a send/merge group
getGroups	Get a list of the available 'send' and 'merge' groups
getKeyword	Get the availability of a keyword for use on our 88802 short code number
getLastErrors	Get the errors returned from the last call to the API
isLoginValid	Check the username/password credentials used are valid
sendSMS	Send an SMS to a given recipient
deleteSMS	Delete a previously scheduled SMS
transferCreditsToAccount	Transfer credits to a specified account number
transferCreditsToUser	Transfer credits to a specified account username

All function call examples should be placed in a Java try-catch block, as described in [Handling errors](#) . Each example assumes you have already instantiated the wrapper object and assigned it to the variable tmClient:

Example

```
RestClient tmClient;  
tmClient = new RestClient("myAPIusername", "myAPIpassword", RestClient.ENV_SANDBOX);
```
