addGroup - PHP

Create a new 'send' group.

Example

```php
$group = $tmClient->addGroup('My Group');
echo "The ID of {$group['name']} is {$group['id']}";
```

Arguments:

string **$group**

the name of the group to be created. Up to 25 alpha-numeric characters, and '-' are allowed. The name cannot consist of only digits.

Returns

an array with 4 keys: 'name', 'numbers', 'id', 'is_stop'

Array key	Value
name	String. The name of the group just created
numbers	Integer. The quantity of numbers in the group. Always zero.
id	Integer. The unique ID of the group.
is_stop	Boolean. Whether the new group is a stop group. Always false.

Specific error codes:

Code	Meaning
1	A group with that name already exists (group names are not case-sensitive).
2	The group name is invalid. Only up to 25 alpha-numeric characters, and '-' are allowed. The name cannot consist of only digits, at least one alpha character or '-' must be present.

error code 404 is reported if the group does not exist; error code 400 is reported if the group name was not specified. See General error codes
