

Basics - including the wrapper library - Java

You need a copy of the Java wrapper library file `TMRestClient.jar`, available from [here](#).

You should place the file in your class path or in the folder where you are executing the code.

You must then 'import' the jar library somewhere in your Java code, before you can use it:

Example

```
import uk.co.textmarketer.RestAPI.*;
```

The Jar library file needs to be in your java CLASSPATH or added as a command-line option in your java virtual machine e.g.

Example

```
java -classpath /usr/java/library/TMRestClient.jar
```
