

getGroup - Java

Shows the details of a group. Only gets the details of one group at a time, and includes all the numbers in the group, if there are any. Also lists the numbers in a 'stop' groups - numbers in these groups will never be sent messages. Every account has at least one stop group, so that your recipients can always opt out of receiving messages from you. This is a legal requirement.

Example

```
String[] numbers = tmClient.getGroup("My Group");
for(String number: numbers)
    System.out.println("Number: " + number);
```

Arguments:

String **group**: Group name or group ID to get the numbers of.

Returns: an String array with the numbers of the group

Specific error codes: None.

error code 404 is reported if the group does not exist; error code 400 is reported if the group name was not specified. See [General error codes](#).
