

getLastErrors - Java

Get all errors encountered after the last call to the API.

Example

```
Hashtable<String, String> errors = tmClient.getLastErrors();
for(Map.Entry<String, String> error: errors.entrySet())
    System.out.println("Error code " + error.getKey() + ": " + error.getValue());
```

Arguments:

None.

Returns:

Errors Hashtable with all the errors codes and messages. There may be multiple errors.

Specific error codes:

None. This function never throws an exception.
